

**Welcome**  
To the presentation on

**Landslide Susceptibility Mapping  
Using Multicriteria Evaluation  
Techniques in Chittagong  
Metropolitan Area, Bangladesh**

**BAYES AHMED**

PhD Student, IRDR, UCL

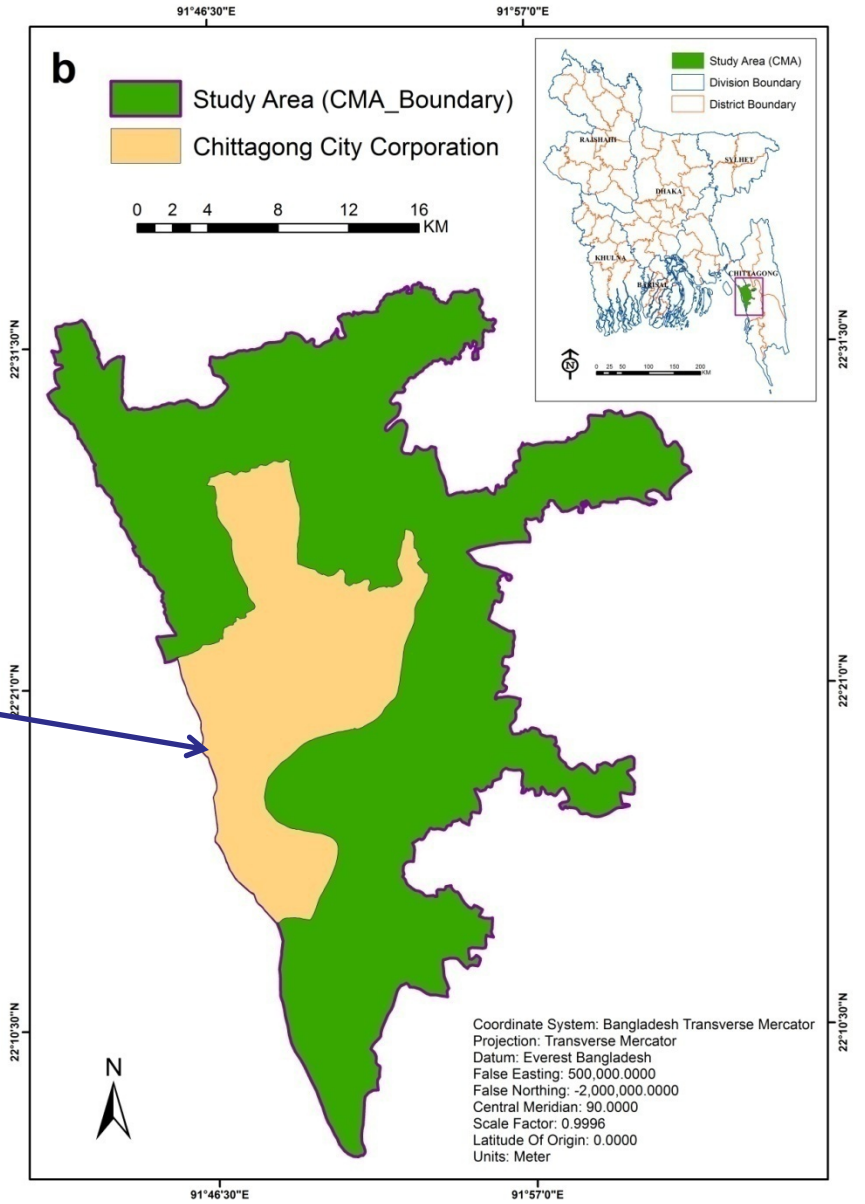

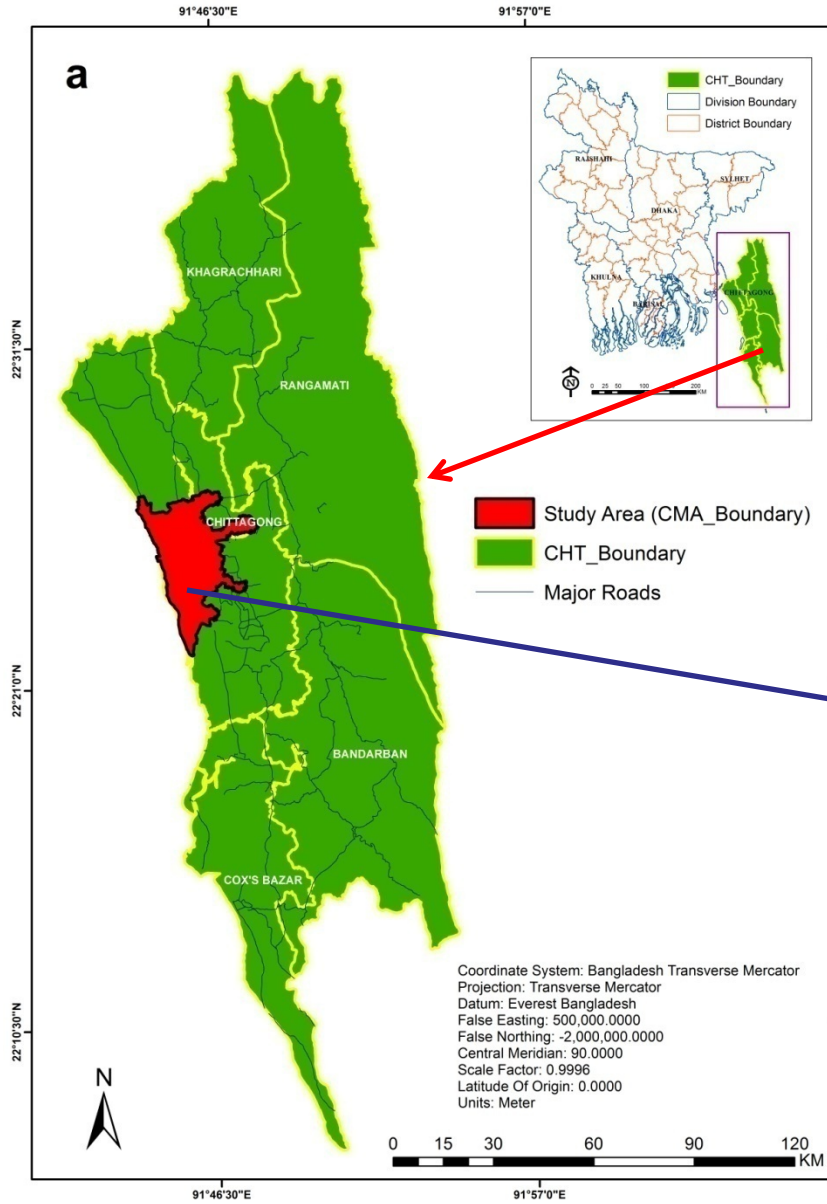

*05 March 2014*

# Background of the Research

---

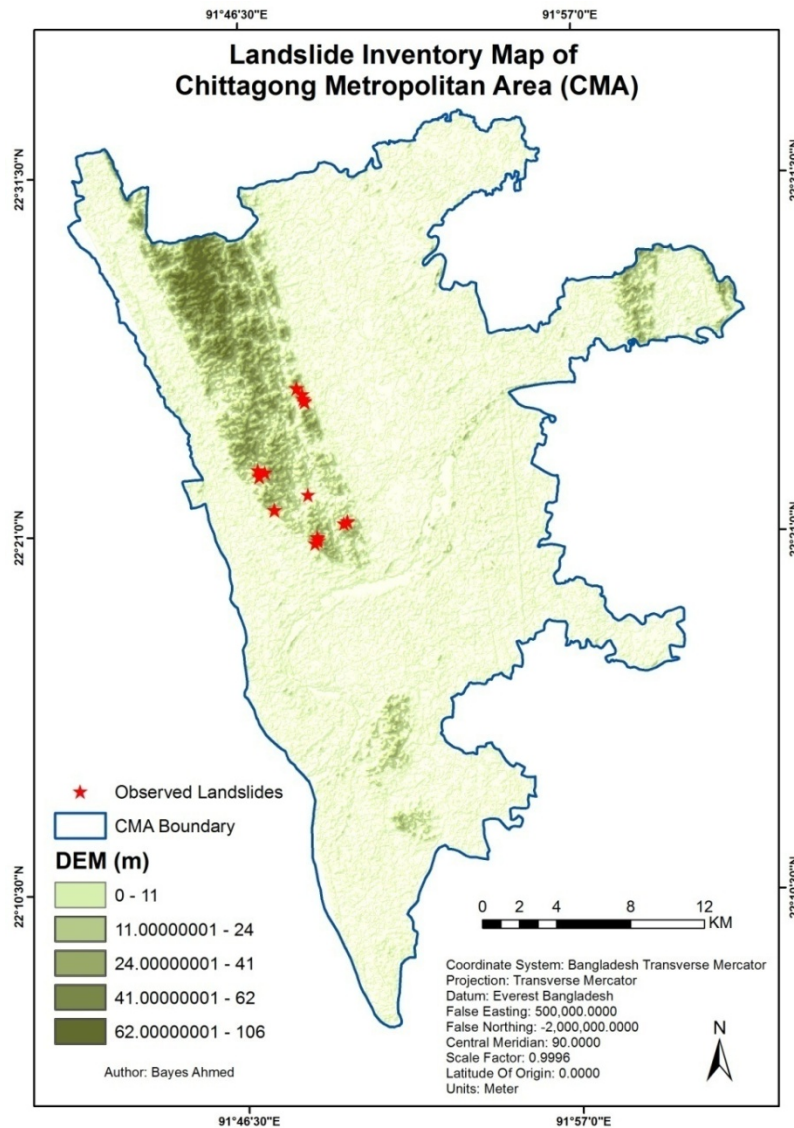

1. Chittagong Metropolitan Area (**CMA**) is highly **vulnerable to landslide hazards**, with an increasing trend of frequency and damage
  2. It is therefore essential to **determine the landslide prone areas** of CMA so that appropriate landslide risk reduction strategies can be developed
  3. Producing **up-to-date** and **accurate** landslide susceptibility maps can ensure **safety to people, property at risk and avoid extensive economic loss**
-

# Study Area

Data source: Geological Survey of Bangladesh, 2000 and Chittagong Development Authority (CDA), 2013

# Landslide Inventory Map

**20** landslide locations were identified through GPS survey in CMA

Source: *Field Visit, March & September, 2013*

DEM Data source: ASTER Global Digital Elevation Model (ASTER GDEM), 2013

# Precipitation Pattern (In-situ Data)

Mean annual rainfall is **2540 - 3810 mm** in CMA. The monsoon season is from **June to October**, which is warm, cloudy and wet. A **gradual upward shift in precipitation** has been noted in the last five decades (1960-2010)

Data source: Bangladesh Meteorological Department, 2013

# Landslide Susceptibility Mapping (LSM)

---

In this research, three GIS based Multi Criteria Decision Analysis (GIS-MCDA) methods have been used for LSM. These are:

1. Analytical Hierarchy Process (AHP)
2. Weighted Linear Combination (WLC)
3. Ordered Weighted Averaging (OWA)

# Landslide Susceptibility Mapping (LSM)

---

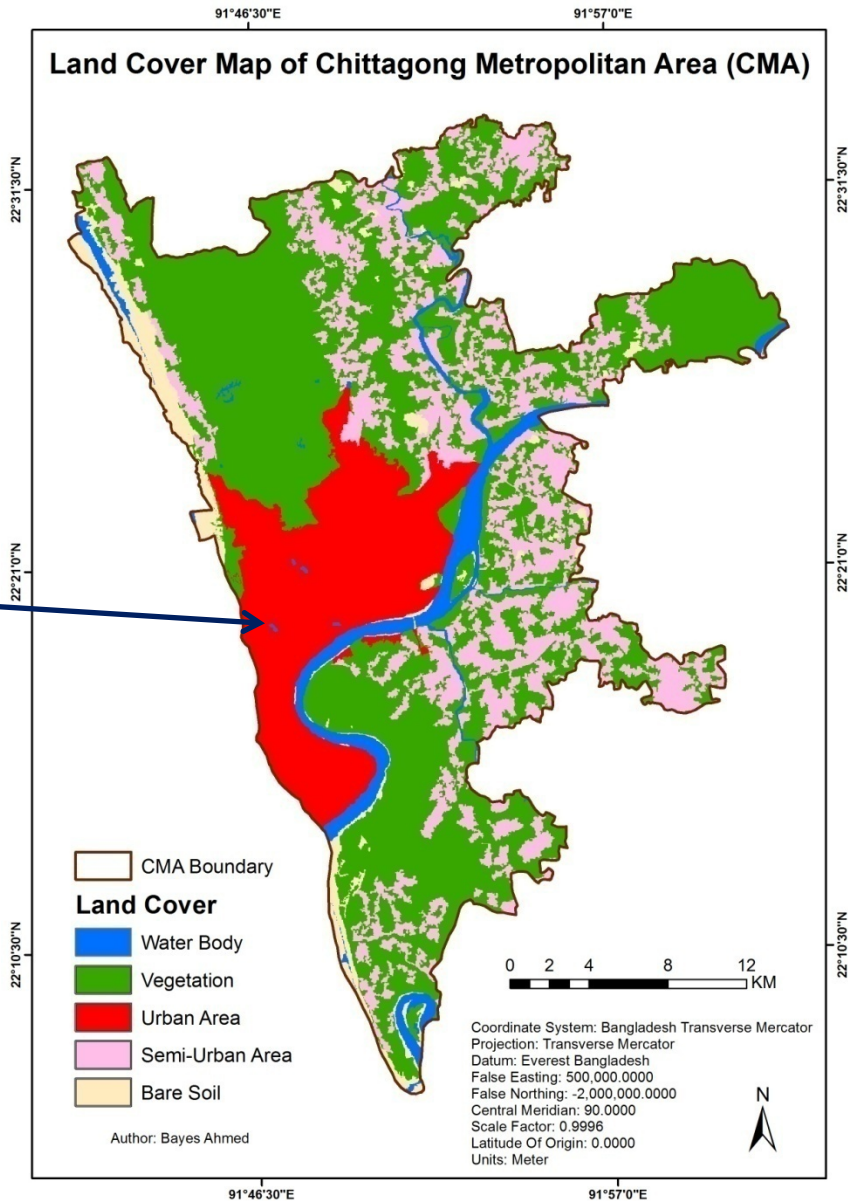

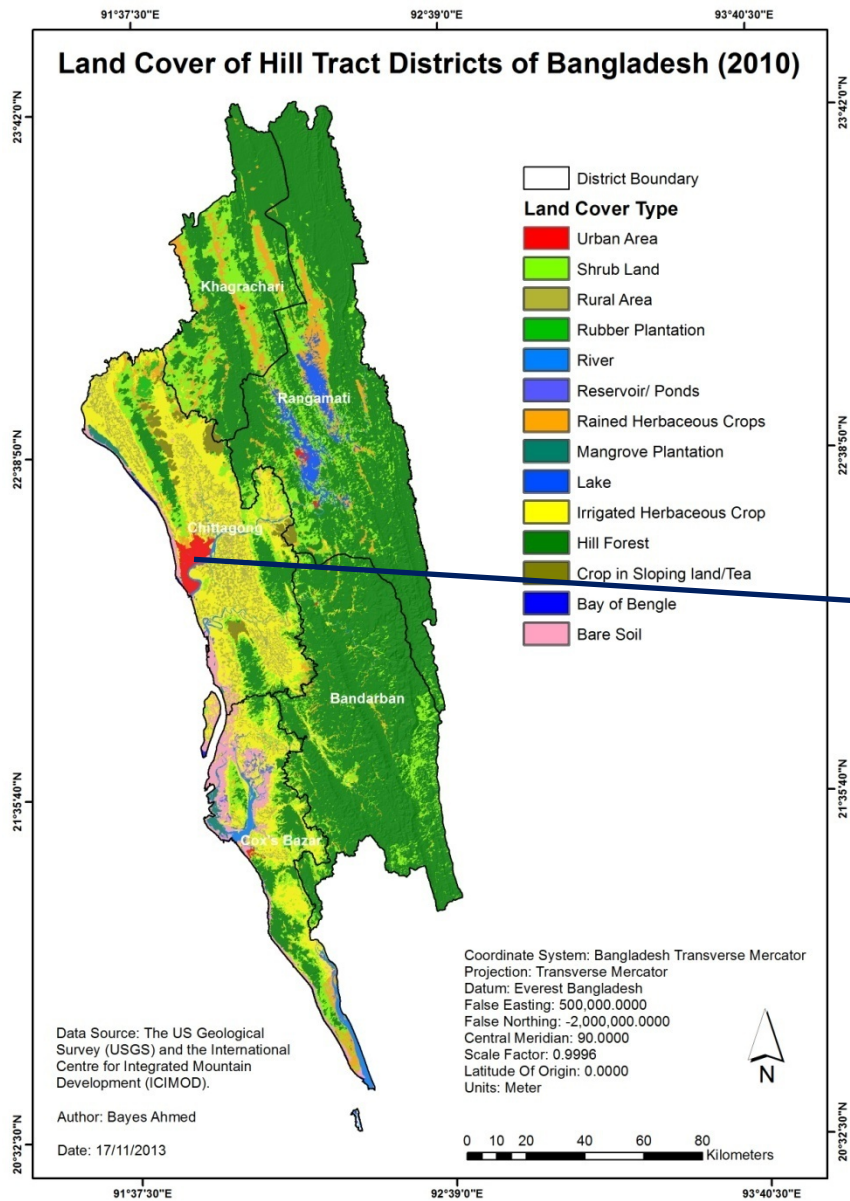

MCDA is basically a **GIS based overlaying method** used to to **combine a set of criteria** to achieve a single composite basis for a **decision** according to a **specific objective**

MCDA is a **knowledge-based method**. The **people's, expert's or decision maker's** preferences get importance

The main drawback of MCDA is only **failing to choose appropriate assumptions/criteria** for suitability analysis

---

# Analysis of the Results

Methods	Susceptible zones	Area under category (%)	Number of landslides	Comparison with landslide area (%)
<b>AHP</b>	High susceptibility	22.713	20	100
	Medium susceptibility	53.609	0	0
	Low susceptibility	23.677	0	0
<b>WLC_1</b>	High susceptibility	41.890	20	100
	Medium susceptibility	36.791	0	0
	Low susceptibility	21.319	0	0
<b>WLC_2</b>	High susceptibility	20.365	20	100
	Medium susceptibility	66.079	0	0
	Low susceptibility	13.556	0	0
<b>WLC_3</b>	High susceptibility	1.5520	18	90
	Medium susceptibility	96.911	2	10
	Low susceptibility	1.5370	0	0
<b>OWA_1</b>	High susceptibility	19.565	20	100
	Medium susceptibility	46.149	0	0
	Low susceptibility	34.286	0	0
<b>OWA_2</b>	High susceptibility	3.4750	18	90
	Medium susceptibility	52.381	2	10
	Low susceptibility	44.144	0	0
<b>OWA_3</b>	High susceptibility	1.3410	9	45
	Medium susceptibility	46.115	11	55
	Low susceptibility	52.544	0	0

# Validation of the Methods (Relative Operating Characteristic)

The AUC values of the AHP, WLC\_1, WLC\_2, WLC\_3, OWA\_1, **OWA\_2**; and OWA\_3 methods were calculated as 0.898, 0.839, 0.911, 0.885, 0.904, **0.951**, and 0.871; respectively

# Thank You All, QUESTIONS?
